A declaration of the vse of the two preceding Tables, very profitable and easie to the meanest capacity.

IF at any time you would know when it will be full Sea in any the aforesaid Havens or places, and what Moone makes a full Sea there: you must first learne how old the Moone is. which you shall finde in the fifth Columne of the Almanacke over against the day of the Moneth for this Yeare. This age of the Moone, if you looke in the head of the second Table (intituled, The residue of the Tide table in houres and minutes) guiding your eye downwards till you come (in the common Angle) over against that figure which directs you to the rest of the places in the first Table: under that age of the Moone shall you finde houres and minutes. which is the time of full Sea that day in the Haven desired.

Example.

I Would know at what time it will be full Sea at London-bridge (which is alwaies when the Moone is South-west or North east) the first day of January this Yeare. Over against the said first day of January, I looke in the fifth Columne of the Almanacke and I finde the figures 26, which sheweth that the Moone is 26 daies old: this 26 I looke in the head of the Table (intituled The residue, &c.) which I finde joyned with 11, which signifieth, as the Moone makes a full Sea at 26 daies old decreasing, so at the same houre and minute when she is 11 daies old encreasing. Now guiding mine eye downeward in that Columne, I finde these figures 11 above and 48 under, which is as much as to say, it is full Sea at London-bridge the first of January at 11 of the clocke, and 48 minutes past, and then the Moone is South-west or North-east; so it is likewise at Tinmouth, Hartlepoole, Whitbay, Amsterdam, Gascoigne, Brittaine, Galizia. Doe thus with any other place, and it is very easie.

Yet you must observe that it floweth one point of the Compasse more in the Spring tides, that is, at the full and new Moones, than it doth in the Neap tides, that is, at the quarters of the Moone, especially if it bee a River where there is any indraught, and that is of good distance from the Sea; yea when there is neither rage of winde, nor other cause to hinder or prevent the said effect; As for example, It floweth at London-bridge at the full or change of the Moone, when she is South-west or North-east: but in the quarters of the Moone

it scarcely floweth there when the Moone is South west and by South, or North-east and by North. And this is generally true forever. So likewise the latitude of the Moone raiseth or hindreth the Tides. for if she have North latitude shee riseth sooner, and brings in the Tides earlier, than when she hath South latitude, so also if she have a fit aspect to Venus in moist Signes, it will wonderfully encrease the tides; but if to Mars or Saturne in dry Signes the Tides diminish: sometimes Land-floods encrease the Tides, and other causes there be which for brevity I omit

The Sea hath fits; alternate course she keepes;
From deepe to shore, and from the shore to deepes.
What ere the cause be, it nere resteth stound,
But's ebbing, flowing, alwaies going round:
Sure *Cynthia* (nights Lampe) with her changefull lawes
Commands the Ocean, and its motion cause.

The Contents of the severall Columnes in the Almanack.

The first is the Daies of the Moneth.

The second, the Daies of the Weeke, being the Dominicall or Sunday letter.

The third is Saints Daies.

The 4 is the Signe and Degree the Moone is in at noon.

The fifth is the age of the Moone.

The sixth is the houre and minute of Sun-rising at London, which if you double you have the length of the night, but if you substract it from 12 you shall have the Sun-setting, which Sun-setting doubled is the length of the day: As for example, The Sun riseth the 2 of January at 8 a clocke, which doubled is 16 houres the length of the night: but if you take the Sun-rising from 12 there resteth 4 a clocke the houre of Sun-set, which Sun-set doubled, is 8 houres the length of the day. Doe thus with any day.

The 7 is the Aspects of the Moone to the Planets & of the Planets among themselves with the houre thereof. The letter (a) standeth for afternoone or night; and the letter (b) before noone or in the morning. As on the 8 of January you finde these characters (☌☉♄ 7 a) which is a Conjunction of the Sun and Saturne at 7 a clock afternoo or in the night. So the next day you finde these (☌☋☽ 8 b) which is a conjunction of Venus and the Moone at 8 a clocke before noon or in the morning, ẅ a probable conjecture of ☿ weather, &c.

January hath xxxi. dayes.

New Moone the 5 day, at 5 a clocke in the morning.
First quarter the 13 day, at 6 a clocke in the morning.
Full Moone the 19 day, 20 minutes past 10 a clocke at night
Last quarter the 26 day, halfe an houre past 8 at night.

Sol entring Aries, Mercury's in the South,
And Cancer rising bids us feare no drouth,
And Iupiter beholding by a Tryne
Hermes so mounted, Venus doth combine;
The Moone and Pleiades sweetly influing,
Are great forerunners of a forward Spring.

The accompt beyond Sea.

See how the jarring Elements agree!
Fire cleeres the Aire, Aire sweepes the Earth, we see,
Earth beares the Water, Water moistly milde
Cools Fire, calmes Aire, & gets the Earth with child
And now who doth not feel, hear, smel, (the powers)
The force, sound, sent; of starrs, of winds, of flowers.

May hath xxxi. dayes.

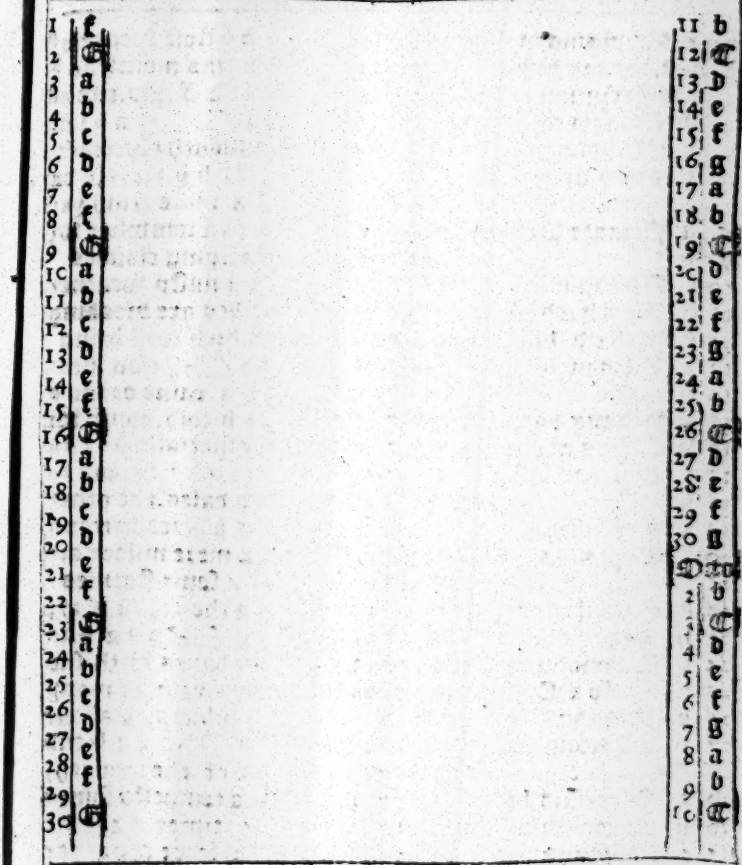
Most of this Moneth's in equall temp'raments,
Neither too hot, or cold, too moist or dry
And yet S. Michael saies, the Elements
By heavens seven bright Lamps moov'd diversly,
In secret power raise boisterous stormy puffes
Squeesing moist cloudes by mutuall counterbuffes.

The Account beyond Sea.



October hath xxxi. dayes.

First quarter the 4 day, at 7 a clocke in the evening.
Full Moone the 12 day, halfe an houre past 9 at night.
Last quarter the 20 day, 40 minutes past 3 in the morning.
New Moone the 26 day, a quarter past 10 in the night.

Now our Herculean taske is at an end:
Twelve Moneths, 12. Signes, and what the 7 portend
By their Configurations, let us know,
That God by them his handy worke doth show,
And that the azur'd Heavens so framed are
That Gods excelling glory they declare.

Dici Orbes, Terramq; appellant sydus opacum.
Sed quid Aristoteles, vel quivis dicat eorum;
Dicta nihil moror, à vero cùm fortè recedunt.

Of the foure Parts or Quarters of the Yeare.

Of Winter.

WInter is the first Astronomicall Quarter of the yeare, and tooke beginning (according to the ancient custome of the Church) in the moneth of December, in which CHRIST was born, and that time of the moneth in which the Sun entred the first scruple of (the cold, earthy, and dry Signe) Capricorne: which was like wise supposed to be the day of CHRISTS Nativity, and then the shortest day of the yeare, and it was then on the 25 day: But the Suns entrance into Capricorne is not now on the 25 day, by reason of the anticipation of the Æquinoxes and Solstices going back in every 134 yeares (or very neare) much about one whole day; so that the Suns entrance into Capricorne was the last yeare 1637 upon Monday the 11 day of December a quarter past 10 of the clock in the forenoon in this our latitude, somewhat more than 13 dayes gone backe. And so much is the difference between our observation Politicall and Astronomicall of CHRISTS Nativity, which in processe of yeares would fall in Summer, if our accompt remaine uncorrected, notwithstanding the Reformation ulen beyonn the Seas: For neither of these Accompts are true: And the Reformed Accompt (although exactly) was but calculated from the Nicene Councell, which was in Anno CHRISTI 328. to the yeare 1582. which Radix should have been at CHRISTS Nativity: But this hath been already mentioned in my last Almanack for the Leapt Yeare.

According the Astronomicall position of the heavens the day afore-mentioned, it is found that the Sun at this his ingresse into Capricorne is in the ☌ of ☿ in ♑, and the ☽ in △ to ♂, and he and ♀ in ♒ in the Ascendent: ♃ is in the Mid-heaven, and ♄ in the 12 house in ♈ Lord of the Ascendent:

cendent in □ to ♂ & ♃, both w̄ are together in the 8 house, all w̄ together considered, argue a warmer & moyst Winter, than cold and dry, not without frost & snow intermixt, as you may observe on the proper daies, together with furious winds: the causes are plaine, which the Reader may as easily learn out of the Almanack, to which I referre him.

As for other contingents, upon all sublunaries, which the Ancients have observed out of the various configurations & positions of the Starres; I forbeare to mention my Collections, leaving every man to be his own Interpreter, Cynthius aurem vellit. And our English Proverb saith, *Thought is free.*

The dayes are now at the shortest, being but 7 houres and 34 minutes long, (the space of time the Sun shineth in our Horizon at London) For rising at 13 minutes past 8 in the morning, and setting 47 minutes past 3 in the afternoon, he continueth under the earth (or maketh with us the longest night by reason of his absence) 16 houres 26 minutes long.

Benedicite { *Rores, & Pruina,* / *Gelu, & Frigus,* / *Glacies, & Nives,* } *Domino:* { *Laudate & superexaltate eum in sæcula.*

Of the Spring.

The Spring beginneth on Saturday the 10 day of March, halfe an houre past 10 of the clock in the forenoone, equalling the day and night throughout the world; and now the Sun applieth nert to the ✶ of ♄, which seemeth to keep back the Spring; but when I see the hot and martiall Starre, Caput Herculis, in the Ascendent, I am induced to think otherwise; besides, the benevolent Planet ♀ is with the ☽ neare the 7 Stars, which you may observe not farre asunder that very evening, as also the △ ♃ ♀ in moyst Signes, are great probabilities of a forward Spring, with fruitfull showers and ayre-purging winds, and by this position: Effectus benevolos tam in Megacosmo quam in Microcosmo, proferre solet: In Magno Cosmo dico, nam in eo corpora dulcescunt, aer mitescit, nives dissolvuntur, scaturiunt fontes, arbores suis frondibus viridibus gaudent, animalia parturiunt. In Microcosmo, humores naturales, & præcipue sanguinem auget & renovat, illumq; per universa corporis sui membra diffundit & dispensat, & ob istam rationem temperamentum in eo æquale

quale signit. But when I see the afore-said violent Starre Pollux or Caput Herculis in the Ascendent, and Mars in the sixth house being the house of sicknesses, in ♌. And Saturne in the eighth house, the house of death, I can no lesse than iudge it a perillous time to those, who in their nativities or revolutions have the Sun, Moon, Midheaven, Part of Fortune, or Ascendent, or any principall significator in ♌ ♐ ♊ between the 12 and 17 degrees, in ♋ and ♍ between the 10 and 15 degree, and in ♒, ♑, or ♏ betweene the 5 and 10 degrees, so likewise those in the first halfe face of ♏ and ♓, ♉ and ♎, will suffer diverse and sundry maladies proceeding from bloud over-heated, such as be hot and violent Feavers, Frenzies, raging madnesse, &c. From which *Good Lord deliver us.*

Compertum est quod quælibet Stellarum erraticarum, imo vero & fixarum, vis atq; virtus, aut conjunctione Radiorum aut oppositione, Trino, Quadrili aut Sextili Aspectu, ad influentias diversas in inferiora effundendas, sit aptior & proclivior, uti ☉ coiens cum ♄, tristes, melancholicos, & graviores producit effectus, tam in elementis supernis, quam in ipsa terra, & in inferioribus.

And so must de iudged of the rest of the aspects of the Planets, the most forcible whereof I have noted against every day of the moneth as they happen, the effects of which may be guessed at from the natures of the Planets mentioned in its proper place. And so much for this Quarter.

Benedicite { *Omnis Imber, & Ros,* / *Noctes, & Dies,* / *Lux & Tenebræ,* / *Universa germinantia in terra,* } *Domino:* { *Laudate & superexaltate eum in sæcula.*

Of Summer.

THe Summer beginneth on Monday the 11 day of Iune, 26 minutes past two a clock after-noone, at which time Sol, cœlestium princeps & Planetarum, Fixarumq; choragus, enters the Signe Cancer, iust at which instant Iupiter irradiates the Ascendent, Et perstringit Horizontem cum corpore suo benevolo, qui clementissimus rerum sublunarium est fotor, sospitator, fructifer & sator, which argueth a very wholsome, and pleasant Summer, with sweet breathing gales of wind: yet the position of Saturne in the North Angle, to whom the ☽ doth next apply by a □, and the next day after to the ☍ of Venus, may produce cloudy, dark, caliginous ayre, but I hope

hope not hurtfull, nor of long continuance, I rather suppose this posture will cause remission of heat this Summer, whereby as the season will be more acceptable, so have we greater cause to be thankfull to the GOD of nature.

The Sun is nearest to our Zenith, and now in his greatest altitude, causing the day to equall the longest winter nights; And in these Northerne Climates producing the day to such a length, as in our Meridian it is 16 houres 26 minutes betweene Sun rise and Sun set: at Rome it is 15 houres, at Paris 16, at Yorke 17, at Edinborough almost 18, at Thule Isles 19, in the middle of Greenland 22 houres long, and so the further North the longer Dayes; to some a moneth, 2, 3, and 4 monethes long, that under the North Pole they have but one day and night in the whole yeare, that is to say, a day halfe a yeare long, and a night halfe a yeare long. And thus much for the Summer.

Benedicite { *Ignis, & Æstus,* / *Frigus & Æstas,* / *Fulgura, & Nubes,* } *Domino:* { *Laudate & superexaltate eum in secula.*

Of the Harvest, or Autumne.

THe Autumne initiateth when the Sun toucheth the first minute of Libra, ballancing the day and night againe, and it happeneth this yeare on Thursday the 13 of September, 6 minutes past 5 in the morning, the Sun is then in the Horizon in application to a Trine with Saturne the same day of his ingresse, Mercury likewise with Spica ☍ is Lord of the Ascendent, and applieth in few dayes to ♄ his □, which will undoubtedly bring some cold and moyst South-East winds more than usuall. The ☽ within an houre after setteth just as the Sun riseth, being then full of light, hasting to the □ of quarrelling Mars: In this Revolution betwixt Michaelmas and the 6 of October there is a double coniunction of ☿ and ♀, causing a furious conflict of winds, and upon the 22 of October there is a notable coniunction of Saturne and Mars: with many other great Aspects of the Planets superiour and inferiour during October and November, noted against each severall day (as they happen) in the Almanack.

Quamdiu erit Terra: Sementis & Messis, Frigus, & Æstus, & Æstas & Hyems, Dies, & Nox, non cessabunt.
Gen. 8. Vers. ult.

Benedicite

Benedicite omnia opera Domini Domino: Laudate, & superexaltate eum in sæcula, &c.

Of Eclipses.

FIve times shall the glorious Lamps of heaven be deprived of light this yeare. The greater light the Sun shall be thrice darkned: The first time wilbe on the fourth of January, old stile, a great and terrible Eclipse, in Persia, Caffania, India within & beyond Ganges, Tartary the Great, and China, with the places adioyning, to the quantity of 11 digits. The second of the Sun will be on the first of July, ten parts darkned, and conspicuous to the inhabitants of the South neare Magellanus Straights, the Gulfe of S. Sebastian, and those that are in 60 degrees of South Latitude. The third Solar darknesse will be but small, it will be on the 25 of our November, and very neare to those inhabitants, in interiore Magellanica circa Polum Antarcticum, but none of these shall any inhabiting in Christendome behold.

The Moone (the lesser light) shall likewise twice be deprived of her borrowed light by the Earths interposition between the Sun and her, which first will happen to the inhabitants Westwards from us, 7 houres 43 minutes, in the Longitude of 280 degrees and a quarter, some 17 digits darkned, upon the 15 day of June.

But that Eclipse which we shall see shall be upon Monday the 10 day of December, at which time at 27 minutes past midnight we shall behold the Moone beginning to be darkned: and at 22 minutes past one a clock she shall be in the beginning of her totall darknesse. The middle of her Eclipse will be halfe a quarter past two a clock in the morning at the 11 day, at which time she will be of a very black colour inclining to be greene. The end of her totall obscuration will be at 3 a clock in the morning, and she will recover her full light just at 4 a clock: so that from the beginning to the end will be three houres 43 minutes. The Moone is in the ninth house in domo Religionis, in oppositon to ☿ Lord of her place, he is with the Dragons head in ♂ to the ☉ in the third house, ♀ and ☿ are in the second house in mutuall reception one of another, ♄ in the 4, ♃ & ♂ in the 5t.

The effects will exercise on those that have any of their significators or Hylegiacall places in the last face of ♊, ♌, ♎, ♑: and will produce notable accidents to them, beginning about S. Iames tide in the nert yeare, but more conspicuous in the middle of August and September, and the end of this influence will be in the middle of November following.

Of the natures, properties and effects *of the seven Planets.*

Of Saturne ♄.

THe Planets differ from the fixed Starres, and may be knowne from them thus. First the fixed Starres are higher than the Planets, which the corporall coniunction of the Planets with them doth plainly manifest: for the Planet is under the fixed Starre, and doth hide it, by interposing betwixt it and our sight; and amongst the fixed Stars there are some of the first magnitude in the Zodiaque, with whom the Planets may ioyne corporally by reason of their small latitude from thence; such be the Buls eye in 5 deg. of ♉, the Lions heart in 25 deg. of ♌, Spica ♍ in 19 deg. of ♎, the Scorpions heart in 5 deg. of ♐, with some others of lesse magnitude neare the Zodiaque, that any the Planets being in ☌ with, may be easily knowne: and the fixed Starres are not so called, as if they were immoveable, Et certo aliquo loco cœli affixæ: But they are so called fixed, for that they keep alwaies one and the same latitude and position one towards another, (although they alter their declination) and they move not (to be perceived) a degree in longitude in little lesse time than 100 yeares: and againe, the fixed Starres by reason of their great distance from us (in respect of the Planets) do alwaies twinckle, some more, some lesse; but the Planets never twinckle. Now that Saturne may be knowne, it is to be observed, that he is superiorum altissimus, and is of a pale, leaden and swarthy colour, and may be seene from after the 9 of Ianuary to rise before ☉ till the 17 of July, when he is opposite to the ☉, and

☉, and becomes Occidentall, and so continuing in Aquarius (the first face thereof) all this yeare, he is retrograde from the 8 of May untill the 25 of September, and the first of February at midnight, March the first at noone, and the 28 day at midnight, and on S. Marks day at noone, May the 22 at 8 at night, Iune the 19 at one in the morning, Iuly the 16 at 2 in the morning, August the 12 at 3 in the morning, September the 8 at 7 in the morning, October the 5 at 3 after-noone, November the 2 at 2 in the morning, and the 29 day at 3 a clock after-noone, and the 27 of December at 4 in the morning, the Moone is to be seen in coniunction with Saturne: So also the 23 of October at two a clock in the morning is a great and notable coniunction of ♄ and ♂ in the beginning of ♒, ♂ being lower than he a degree and halfe, by meanes whereof it is easie to know ♄, He is 30 yeares in compassing the Zodiaque, according to the Verse,

Annis triginta Saturnus conficit orbem,

Complexionem dirigit, frigidam & siccam (melancholicam) ideo rigentis & gelidæ naturæ dicitur. Et *Saturnus* appellatur a saturitate, vel quod annis saturetur: He is an enemy to humane nature, and the greater infortune: and if he be well seated, he is among the Planets as a grave Counsellour is in a kingdome, otherwise a Rebell. His aspect, but especially his coniunction with ♃, in Spring and Harvest bring wind and raine, in Summer haile and thunder. With ♂ in Spring and Summer, raine, haile and thunder, in Harvest and Winter, cold raine, or snow: With the ☉ he causeth Apertio Portarum, or when the ☽ goes from the ☉ to him, or from him to the ☉ by any beames, then is great alteration of weather, for in Spring and Harvest he causeth cold raine, haile and snow: In Summer, thunder, haile, raine and dark weather: in Winter snow and frosty weather: and this Aspect est argumentum magnum veritatis & certitudinis Astrologiæ. ♄ with ♀ in Winter causeth cold sudden showers, snow or raine, and at all times sudden cold raine. With ☿ a tempest, very windie & moist. In Winter, raine or snow, Et miram addit frigoris acrimoniam, ♄ with the ☽ in Spring and Summer, clouds, dark and moysture, in Harvest hoare frost and cold ayre, in winter cold raine or snow, & somtimes frost: and when he rules, the East-wind doth commonly blow. Furthermore,

Saturnus *significat lividam prolem, Iudæos, Maxos, Monachos, Decrepitos, Rusticos, Coriarios, Sutores, Figulos, Vespillones,*

lones, Cloacarios, &c. Et si sit bene dispositus, habet significationem de Aditicijs, ducendis Aquis, Hæreditatibus, & Laboribus. Sed si fuerit cadens & infelix, de morte, luctu, miseria, desperatione, & carcere. At si fuerit potens ac malè dispositus, de conciliis malis, calumnijs, & oppressione miserorum, cogitat.

Mortales odio infestans & peste maligna
Falcifer immitis devorat ora senex,
Ora modis mirjs, semper cum lucida pallent,
Invidia huic cordi est, ambitioq; latent.

Of Iupiter ♃.

IVpiter (so called quasi juvans pater) superiorum medius. He is sanguine, hot and moyst, natures friend, and the greater Fortune: And as a good Governour is in a kingdome, so is he amongst the Planets, he is 12 yeares in going his circuit, as many years as the Sun is moneths. He is termed the father of clearenesse, producer of wholsome gales, and causeth faire weather, he is of a bright fulgent Aspect, and you may observe him in the mornings from the beginning of the yeare till the 10 of Aprill, after which he shineth in the evenings till the 29 of October, he wanders through the later part of ♌ and beginning of ♍ all this yeare: and is retrograde from the 9 of February till the 10 of Iune, but all the yeare else he is direct: he is with the ☽ the 25 of January at 10 in the night, February the 22 at 8 in the morning, March the 21 at 2 after-noone, Aprill the 17 at 4 after noone, on Whitson-Monday at 5 at night, Iune the 10 at 8 at night, Iuly the 8 at 5 in the morning, August the 4 at 6 at night, September the first at noone, on Michaelmas day at 7 of the clock in the morning: all which times the ☽ and ♃ are very neare together, the 27 of October at 3 in the morning, he is againe with the ☽, but not to be seene, because the ☉ is in conjunction with him the 29 day: likewise this yeare ♃ is three times in ☌ with ♄, the 30 of September at 5 in the morning, the 4 of October at 11 at night, and the 18 of November at 7 in the morning, about which dayes look for tempestuous winds, &c. So also he is once in ☌ with ♀, which is on the 22 of November, and the next morning you may behold the ☽ very neare to ♃

and

and ♀, by which meanes he may be knowne. His Aſpect, but eſpecially his ☌ with ♂ in the Spring and Harveſt, cauſeth heat, raine, thunder and lightnings: In Summer thunder and lightnings, with exceſſive heat, in Winter he cauſeth ſnow, dark, cloudy, turbulent weather, and great winds: with the ☉ he driveth away raine by great winds, ſometimes in Spring and Harveſt he bringeth haile, in Summer thunder and lightnings, but moſt part faire in all quarters of the yeare. With ♀ in moyſt ſignes, he brings mild raine and wholſome ſhowers, but in other ſignes faire and pleaſant weather: with ☿ it is Apertio Portarum, ingendring moſt vehement winds and bluſtring ſtormes: and as often as the ☽ goes from him to ☿, or from ♀ to him by coniunction or aſpect, be ſure of winds, ☌ with the ☽ brings faire weather, and ſometimes white diſperſed clouds, in his dominion hee ruleth the North wind.

Utilis affulget Jucundo ſydere terris
Iupiter, *unde* Juvans dicitur eſſe pater.
Jura, Magiſtratus, Fora, Templa tuetur, & Urbes:
Juſtitiâ clarus, conſiliiſq; viget.

Et ſub love *roſea proſapia, Principes Eccleſiaſtici, Epiſcopi, Sacerdotes, Judices, Senatores, Officiales, Conſiliarii, Juriſconſulti, &c. Si bene diſpoſitus, de honoribus, divitiis & magiſtratu cogitat. Si cadens, de luxu, miſericordia, patientia, & perferendis incommodis. Si potens & malè diſpoſitus, de ambitu, pompa, & prodigalitate.*

Of Mars ♂.

MArs (ſuperiorum infimus) quaſi Mavors dicitur, quia martibus in bello præſidet, he is intemperately hot and dry, cholerick of nature, malevolent, the leſſer infortune, he is 2 yeares in going his Zodiacall circle: if well placed, he is amongſt the Planets as a good captaine is amongſt ſoldiers, but if ill placed, he playes the tyrant, he is of a fiery red colour, and is to be ſeene in the mornings from the beginning of the yeare till the 29 of May, at which time he becomes Occidentall, and to be ſeene in the evenings from thence till the 26 of July 1639. He is retrograde from the 27 of April this yeare, till the 4 of July following, all the yeare

yeare elſe he is direct, January the 27 at 6 in the morning, February the 24 at 5 at night, Easter-day at 4 in the morning, the 21 of Aprill at 8 at night, the 18 of May at 10 in the night, June the 14 at noone, July the 11 at noone, August the 8 at 8 in the morning, September the 5 at Sun-ſetting, October the 4 at 3 after-noone, November the 2 at 4 in the evening, and December the firſt at 7 in the night, and the 30 day at 9 in the night, ♂ and ☽ are neare together. Beſides the notable ☌ of ♄ and him the 23 of October at 2 in the morning, ♄ being above him a degree and halfe. The Aſpects of ♂, but eſpecially his ☌ with the ☉, cauſeth dry winds, or drought, in watry ſignes thunder and raine, in Winter great winds, raine and ſnow. With ♀ it is apertio portarum, cauſing in Spring and Autumne raine, in Summer, ſhowers, with thunder and lightning, in Winter cold and ſnow. With ☿ in windy ſignes, great winds, and perhaps thunder and lightning, in hot and dry ſignes heat and drought, but generally he brings fierce, ſudden and impetuous winds, with variety of weather, and when he is with the ☽, he changeth the weather as the ſeaſon requires, for in Summer he brings heat intemperate, thunder, lightning, concuſcations, and fiery impreſſions, and in watery ſignes raine and diverſe coloured clouds, and when he is Lord Paramount, the Weſt wind bloweth.

Marte *dolus, prædæ, cædes, violentia regnant;*
Proditio, bellum, miſcentur ſacra prophanis.

Et ſub Marte, *Ruffa propago, omnis generis Milites, belli Ductores, Satellites, Medici, Chirurgi, Alchimiſtæ, Bombardarii, Laniones, Lictores, Carnifices, Latrones, Opificia ignis, artes Fabriles, &c. Si bene ſit diſpoſitus, de itinere, fabrica & militari dignitate. Si ſit infœlix, de furtis, ludo, de Superûm contemptu, & ſerendis diſcordiis. Si verò potens, ſed malè locatus eſt, de cæde, incendio, rapinis, & vindicta cogitat.*

Of the Sun ☉.

SOl (Planetarum & Fixarum Choragus) quaſi ſolus lucens, for all other lights become dark at his approach: He is Oculus & Anima mundi, and as in the body of man Cor Sol corporis, ſo in the heavens Sol cor cœli, he is tanquam Rex, Dux,

Dux, Pater, & centrum amoris omnium Planetarum, a quo vires accipiunt.

By him we calculate our Grandſires dates,
Th'increaſe of Kingdomes, and decay of States:
By him we meaſure out to us and ours,
Yeares, Ages, Seaſons, Moneths, Dayes, Minutes, Houres.

Sol annum in quatuor partes diſpertit: Ver floribus, Æſtatem maturis fructibus, Autumnum uvarum collectione, Hyemem triſtiſſimo & immiti frigore depingit & figurat: Nihil eſt rerum naturalium quod ejus vim non affatim perſentiſcat.

His conjunction with ♀ cauſeth raine (as upon the 22 of Aprill this yeare) and ſpringing ſhowers with ☿, in aery ſignes winds, but if ☿ be retrograde in moyſt ſignes, (as on the 27 of Aprill) winds and wet, ſo alſo againe the 23 of Iune or thereabouts: and the ☉ hath no Aſpect to ♀ and ☿, but ♂: The ☉ with ☽ altereth the ayre to the nature of the ſeaſon, and if he be ſtarct in dominion with ♄, he produceth the Eaſt wind, with ♃ the North, with ♂ the Weſt, and with ♀ the South.

Sero rubens cœlum, cras indicat eſſe ſerenum,
Sed ſi mane rubet, venturos indicat imbres.
If th'ev'ning ruddy be, next morn is faire:
But if the morn be red, then ſhowers are neare.

Et ſub Sole *pulchri & lætâ facie nati. Imperatores, Reges, Principes, Duces, Marchiones, Barones, Nobiles, Magiſtratus, Generoſi, & Domini magnanimi, &c. Si bene diſpoſitus & locatus, ſignificat magnanimitatem, honorem, ſplendorem, gloriam, &c. Et è contrà, ſi ſit infortunatus, malè diſpoſitus, & à Planetis malevolis malè affectus, &c.*

Of Venus ♀.

VEnus (inferiorum primus) a venuſtate: ſhe is the cleareſt, brighteſt, and moſt reſplendent ſtarre in the firmament, the Luminaries excepted; ſhe finiſheth her courſe in a yeare (as the ☉) although this yeare ſhe continue in ♉ from the 22 Day of February to the 29 of Iune, being 28 weeks. All which time ſhe is miſtris of her own houſe.

Omnia

Omnia tunc rident: ——————
Fundit humus flores ——————
Candidus auratis aperit cum Cornibus Annum
Taurus ——————

And she is something light-heel'd this yeare, apt to fall backward, she is not farre from the ☉ at any time, not in her greatest distance above 48 degrees, at which times she may be seen in the day-time (as to amazement and wonder she did at ♀ time our most hopefull Prince CHARLES was borne, 1630.) and by reason of her copious light, she sometimes casteth a shadow: She is the Suns chamber-maid: For when she is the Morning-starre, she riseth before him, ushering him, and tels us he is not farre off: and when she is the Evening-starre, she lights him to bed. She is retrograde from the beginning of Aprill untill Whitson-tide. The 9 of January at 8 in the morning, February the 8 at 5 in the morne, the 9 of March at 10 in the morning, Aprill 6 at 7 in the morning, May 2 at 3 after-noon, & the 30 day at 2 in the morning, & June 28 at 2 in the morning, July 27 at 3 after-noon, August 26 at 7 in the morning, September the 25 at 2 in the morning, October the 24 at 11 in the night, and November the 23 at midnight. So likewise upon Christmas Eve at 5 in the morning. The ☽ and ♀ are neare in conjunction. So likewise the 22 day of November you may perceive ☿ and ♀ close together, betimes in the morning, and the nert day you may perceive the ☽ neare them, some two degrees under them. When she is with ♀, she raiseth winds and wet, as about S. Georges day this yeare: when she is with the ☽, she causeth in the Spring and Harvest clouds and moysture, and in winter snow and whirle-winds, and she produceth the South-wind, &c.

Lætitiam, choreas, lusus amat, otia quærit,
Commoda dat thalami, fœdera dote beat.

Et sub Venere, *nepotes nitiduli, Musici, Lusores, Gemmarii, Tinctores, Concubinæ, Meretrices, Saltatores, Pictores, Pharmacopœi, homines sanguinei, Virgunculæ, &c. Si ſi: bene dispoſita, de donis, voluptatibus, ornamento, &c. Si cadens, de infami libidine, ganeis, ſcortis, &c. Sed ſi potens & malè diſpoſita, de ſtupris, ebrietatibus, diſſipandis bonis, &c. cogitat.*

Of

Of Mercury ☿.

MErcurius (inferiorum medius) a merce vel mercatura dictus, he is of a mutable and changeable nature, he is quaſi Orator, or the Suns Secretary, ſeldome ſeene, becauſe his greateſt elongation from the ☉ is not fully a whole Signe: he is ſwift of motion, yet finiſheth his courſe but as the ☉ ☿ ♀. For his often retrogradations (being this yeare three times, that is, from the 13 of February to the 8 of March, and from the 11 of Iune to the 4 of Iuly, and from the 4 of October to the 26 day) do hinder his progreſſe: but all the reſt of the yeare he is direct: The 5 of January the ☉, ☽, ♄ and ☿ are together about noone, February the 5 at 2 after-noon, March the 4 at 2 in the morning, Aprill the 2 at 10 in the fore-noone, May the 4 at 7 in the morning, Iune the 3 at 10 in the night, and the laſt day at 3 after-noone, and Iuly the 29 day at 8 in the night, Auguſt the 30 day at 2 in the morning, and on Michaelmas day at 7 in the morning the ☽ is with ♃ and ☿: but the times els mentioned before with ☿ alone. The 26 of October the ☽ is with ☿ againe. So likewiſe the 24 of November at noone, and on Chriſtmas day at midnight. ☿ cum ☽ eſt ventorum Pater, quia eoſdem abdita ſua natura ſuſcitat. Et in Aquaticis ſignis (maxime cum retrogradus eſt, & ſub ſolis radiis latens) pluvias repentinas cum magnis Flatibus: In aeris autem ſignis facit conitrua & fulgura, &c.

Mercurius *fertur brevibus levis æthere gyris*
Inconſtans, varius, nec ſtatione manens.
Mercator bonus eſt; varias largitur & artes,
Applicat ille bonis, applicat ille malis.

Et ſub Mercurio *varium Germen, Negotiatores, Scribæ, Poëtæ, Mathematici, Philoſophi, Monetarii, Mercatores, Bibliopolæ, Typographi, Sculptores,* &c. *Et ſi bene locatus, de artificiis ſubtilibus, ſcientiis & doctrinis,* &c. *Si malè poſitus, de furto cauto, deceptione, & mendaciis,* &c. *Et ſi potens, ſed infœlix, de accuſationibus, venenis, maledicendis,* &c. *cogitat.*

Of

Of the Moone ☽.

LVna (omnium infimus) so called, quia aliena luce lucet; she goeth her course every 27 dayes, 7 houres, and 44 minutes: or, as the verse saith,

Omnem mense polum Phœbe nocturna pererrat:

Her light is weak and mutatitious, eclipsed somtimes by interposition of the earth betweene her and the Sun, and somtimes she depriues us of the Suns light by interposing her opacous and dark body between the Sun and us. She is of a Phlegmatick nature, governes all moist bodies, as is palpable in the flure and reflure of the seas, &c. In shell-fishes, and innumerable such like creatures. She is of the colour of silver, Vnde illa argento, ut & Sol Auro præest: yet by accident she represents diverse colours not in her superficies, but in the ayre about her; and there is a Prognostick verse, of the Moone, which tels us as much, and somthing more, viz.

Pallida Luna pluit, rubicunda flat, alba serenat:

If the Moone smile (the fourth day) 'twilbe faire,
But if she blush, we shall have blustring ayre;
And if her browes be muffled with a frown,
Most of that moneth shall sad teares trickle down.

The Moon is the earths Planet, next to it, & immediately powreth on it the lively influence of the heavenly bodies. She is amongst the Planets tanquam Regina, Mater, & Nutrix.

Et Luna *dat albos filios, significat quoq; Reginas, Domicillas, seu Matronas dominantes, Nautas, Piscatores, Institores, Molitores, Venatores, Nuntios, Aurigas, Tabellarios.*

Quòd maculas vultus alieno lumine fuco,
Muto cuncta, marem nunc peto, nunc fugio;
Quòd vaga, quòd nunquam constans, vis discere causam?
Fœmina sum, uxoris, forsan, imago tuæ.

Thus (in some measure) have you learnt the natures, &c. of the seven Planets, and their Effects, &c. If what is collected

collected be as patiently read, and truly understood, as I have painefully writ it, and honestly meant it, I shall (GOD willing, continuing to write) think my labours well bestowed, and none have cause to complaine, but those that understand me not: For I have written aswell to ease those (the more learned) that can and will not, as to instruct those (the unlearned) that would, but cannot wade, through these deepe sciences: Therefore let him have againe a favourable Aspect from thee, that wisheth thine and his countries welfare, that desires thee to remit former faults, and correct present errours.

——Namq; haud parva injuria certè est,
Si mihi Typographi crimina des vitio.

And till the next yeare farewell.

Thine. *J. B.*

VIVo Deo sIt gLorIa, paX In terrIs, & hoMInIbVs beneVoLentIa.

Amen.

FINIS.
